

Unit 9: DOM Manipulation

Here are some commonly used terms you will find in the upcoming unit. Feel free to refer to this glossary whenever things get confusing!

Term	Definition
DOM	DOM stands for Document Object model. In Javascript, DOM is a programming interface that allows us to create, change, or remove elements from the document. We can also add events to these elements to make our page more dynamic.
JavaScript Events	When a user or the browser manipulates the webpage by interacting with it in any way, it is called an event; these events cause JavaScript to interact with HTML, thereby yielding desired results.
localStorage	localStorage is a property that allows JavaScript sites and apps to save key-value pairs in a web browser with no expiration date. This means the data stored in the browser will persist even after the browser window is closed.
